

Simultaneous state and parameter estimation

- You have now learned how to use Kalman filters to perform state estimation and parameter estimation independently.
 - How about both at the same time?
- There are two approaches to doing so: joint estimation and dual estimation.
- I find that joint estimation (usually) works better and is easier to understand, so that is what I will focus on this week.

Generic joint estimation

- In joint estimation, state and parameter vectors are combined, KF simultaneously estimates this augmented state vector:

$$\begin{bmatrix} x_k \\ \theta_k \end{bmatrix} = \begin{bmatrix} f(x_{k-1}, u_{k-1}, \theta_{k-1}, w_{k-1}) \\ \theta_{k-1} + r_{k-1} \end{bmatrix}$$

$$z_k = h(x_k, u_k, \theta_k, v_k).$$

- To simplify notation, let $\mathbb{X}_k$ be the augmented state, $\mathbb{W}_k$ be the augmented noise, and $\mathcal{F}$ be the augmented state equations:

$$\mathbb{X}_k = \mathcal{F}(\mathbb{X}_{k-1}, u_{k-1}, \mathbb{W}_{k-1})$$

$$z_k = h(\mathbb{X}_k, u_k, v_k).$$

Evaluating generic joint estimation

- Advantage:
 - Quite straightforward to implement: with augmented model of system state dynamics and parameter dynamics defined, we simply apply a nonlinear KF method.
- Disadvantages:
 - Large matrix operations due to the high dimensionality of the resulting augmented model.
 - Potentially poor numeric conditioning due to the vastly different time scales of the states/parameters in augmented state vector.

Generic dual estimation: state evolution

- In dual estimation, separate KFs are used for state and parameter estimation.
- Computational complexity lower, matrices may be numerically better conditioned.
- However, by decoupling state from parameters, any cross-correlations between changes are lost, leading to potentially poorer accuracy.
- Model of state dynamics again explicitly includes parameters as vector θ_k :

$$\begin{aligned} x_k &= f(x_{k-1}, u_{k-1}, w_{k-1}, \theta_{k-1}) \\ y_k &= h(x_k, u_k, v_k, \theta_{k-1}). \end{aligned}$$

- Non-time-varying numeric values required by the model may be embedded within $f(\cdot)$ and $h(\cdot)$, and are not included in θ_k .

Generic dual estimation: parameter evolution

- Also slightly revise model of parameter dynamics to include effect of state equation explicitly:

$$\theta_k = \theta_{k-1} + r_{k-1}$$

$$d_k = h(f(x_{k-1}, u_{k-1}, \bar{w}_{k-1}, \theta_{k-1}), u_k, e_k, \theta_{k-1})$$

- The dual filters can be viewed by drawing a block diagram.
 - The interactions will be made clearer later.
- The process essentially comprises two KFs running in parallel—one adapting state and one adapting parameters—with some information exchange.

Dual estimation using EKF

- When finding $\hat{C}_k^\theta$, total-differential expansion must be correct:

$$\begin{aligned} \hat{C}_k^\theta &= \left. \frac{dh(\hat{x}_k^-, u_k, \theta)}{d\theta} \right|_{\theta=\hat{\theta}_k^-} \\ \frac{dh(\hat{x}_k^-, u_k, \theta)}{d\theta} &= \frac{\partial h(\hat{x}_k^-, u_k, \theta)}{\partial \theta} + \frac{\partial h(\hat{x}_k^-, u_k, \theta)}{\partial \hat{x}_k^-} \frac{d\hat{x}_k^-}{d\theta} \\ \frac{d\hat{x}_k^-}{d\theta} &= \frac{\partial f(\hat{x}_{k-1}^+, u_{k-1}, \theta)}{\partial \theta} + \frac{\partial f(\hat{x}_{k-1}^+, u_{k-1}, \theta)}{\partial \hat{x}_{k-1}^+} \frac{d\hat{x}_{k-1}^+}{d\theta} \\ \frac{d\hat{x}_{k-1}^+}{d\theta} &= \frac{d\hat{x}_{k-1}^-}{d\theta} - L_{k-1}^x \frac{dh(\hat{x}_{k-1}^-, u_{k-1}, \theta)}{d\theta} \end{aligned}$$

- Assumes L_{k-1}^x not a function of θ (it is—weakly—not worth extra computation).
- The three total derivatives are computed recursively, initialized to zero.

Summary

- Two approaches to adapting a model's states and parameters at same time.
- Joint estimation augments both in large state vector, uses single standard nonlinear KF with this augmented system.
- Dual estimation uses separate nonlinear KFs for state and parameter estimation.
- Joint estimation easier conceptually but can be slower due to large matrix operations and possibly poorer matrix conditioning.
- Dual estimation generally faster, but ignores any correlation between state and parameter estimation in its updates.

Joint EKF for state and parameter estimation (1)

State-space model:

$$\begin{bmatrix} x_k \\ \theta_k \end{bmatrix} = \begin{bmatrix} f(x_{k-1}, u_{k-1}, w_{k-1}, \theta_{k-1}) \\ \theta_{k-1} + r_{k-1} \end{bmatrix} \quad \text{or} \quad \begin{aligned} \mathbb{X}_k &= \mathcal{F}(\mathbb{X}_{k-1}, u_{k-1}, \mathbb{W}_{k-1}) \\ d_k &= h(\mathbb{X}_k, u_k, v_k), \end{aligned}$$

where w_k , r_k , and v_k are independent, Gaussian noise processes of covariance matrices $\Sigma_{\tilde{w}}$, $\Sigma_{\tilde{r}}$, and $\Sigma_{\tilde{v}}$, respectively

For brevity, we let $\mathbb{X}_k = [x_k^T, \theta_k^T]^T$, $\mathbb{W}_k = [w_k^T, r_k^T]^T$ and $\Sigma_{\tilde{\mathbb{W}}} = \text{diag}(\Sigma_{\tilde{w}}, \Sigma_{\tilde{r}})$

Definitions:

$$\begin{aligned} \hat{A}_k &= \left. \frac{d\mathcal{F}(\mathbb{X}_k, u_k, \mathbb{W}_k)}{d\mathbb{X}_k} \right|_{\mathbb{X}_k = \hat{\mathbb{X}}_k^+} & \hat{B}_k &= \left. \frac{d\mathcal{F}(\mathbb{X}_k, u_k, \mathbb{W}_k)}{d\mathbb{W}_k} \right|_{\mathbb{W}_k = \tilde{\mathbb{W}}_k} \\ \hat{C}_k &= \left. \frac{dh(\mathbb{X}_k, u_k, v_k)}{d\mathbb{X}_k} \right|_{\mathbb{X}_k = \hat{\mathbb{X}}_k^-} & \hat{D}_k &= \left. \frac{dh(\mathbb{X}_k, u_k, v_k)}{dv_k} \right|_{v_k = \tilde{v}_k} \end{aligned}$$
